INVESTMENT THESIS

Synapse Semiconductor aims to revolutionize machine vision by integrating compute and vision capabilities into a single semiconductor, potentially reducing the need for separate cameras and GPUs [1].

TEAM The team comprises Tania Roy, a Presidential Early Career Award-winning Duke Semiconductor ECE Faculty, and Sanjeev Chauhan, her past student and VC Associate. Team size is reported as 2 [1].	PRODUCT The product is a new vision sensor that runs neural network filters directly in the camera pixels, collecting only data that machines care about. This technology aims to solve physical AI challenges at the semiconductor device level [1].
MARKET The market includes applications in self-driving cars, drones, humanoid robotics, and potentially space exploration. The company claims to be the first to integrate all components of the computer vision stack into one substrate [1][2].	WHY NOW The increasing demand for advanced machine vision in various applications, such as autonomous vehicles and robotics, creates a timely opportunity for Synapse Semiconductor's innovative approach [1].

DIMENSION SCORE BREAKDOWN				
Workflow Pain 6/10 / 25% wt	Speed To Value 4/10 / 20% wt	Compounding Advantage 7/10 / 20% wt	Team Execution 5/10 / 15% wt	Market Distribution 3/10 / 20% wt
KEY RISKS - The technology's complexity and novelty may pose significant development and commercialization risks [1].		WHAT CHANGES OUR MIND - Evidence of successful prototype testing in real-world applications. - Confirmation of partnerships with major players in the autonomous vehicle or robotics industries.
